CSE343 — Web Development

Lab 5 | Task 2: Comments App

Student Name	Mahmoud Badwy Abdelhamied
Student ID	24P0397
Section	3
Repository	https://github.com/mahmoud-badwy/web-development-course-at-university/tree/main/lab5task

Objective

Build a simple React comments interface where users can post comments and like existing comments.

Implementation

The app uses a React function component and useState to store comments and the current text input. Clicking Post adds a new comment to the list. Each comment shows the author label "You," its text, and a like button with a count. Clicking the like button increases the count.

Features

- Add a comment using the text field and Post button.
- Display comments with the total count.
- Like individual comments and update their like counts.

Screenshot evidence

Conclusion

The Comments App demonstrates basic React state management, event handling, components, and rendering lists using map(), following the concepts covered in Lab 5.
